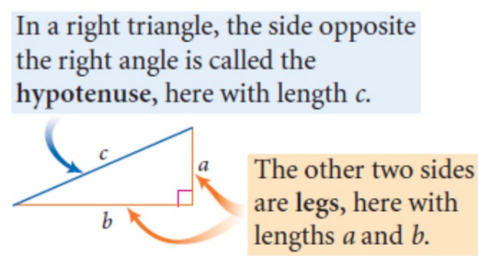
The Pythagorean Theorem 9/22/16

IWBAT understand the Pythagorean Theorem more deeply.

The Pythagorean Theorem 9/22/16

Recall the parts of a triangle.



There is a special relationship between the lengths of the legs and the length of the hypotenuse. This relationship is known today as the Pythagorean Theorem. A theorem is a conjecture that has been proved.

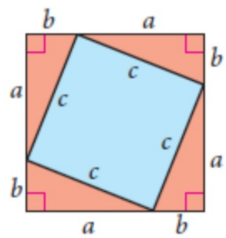
The Pythagorean Theorem

In a right triangle, the sum of the squares of the lengths of the legs equals the square of the length of the hypotenuse. If a and b are the lengths of the legs, and c is the length of the hypotenuse, then $a^2+b^2=c^2$.

IWBAT understand the Pythagorean Theorem more deeply.

The Pythagorean Theorem

You are going to perform the Investigate on DG p. 462.



Paragraph Proof: The Pythagorean Theorem

You need to show that $a^2 + b^2$ equals c^2 for the right triangles in the figure at left. The area of the entire square is $(a + b)^2$ or $a^2 + 2ab + b^2$. The area of any triangle is $\left(\frac{1}{2}\right)ab$, so the sum of the areas of the four triangles is $2ab$. The area of the quadrilateral in the center is $(a^2 + 2ab + b^2) - 2ab$, or $a^2 + b^2$.

If the quadrilateral in the center is a square then its area also equals c^2. You now need to show that it is a square. You know that all the sides have length c, but you also need to show that the angles are right angles. The two acute angles in the right triangle, along with any angle of the quadrilateral, add up to 180°. The acute angles in a right triangle add up to 90°. Therefore the quadrilateral angle measures 90° and the quadrilateral is a square. If it is a square with side length c, then its area is c^2. So, $a^2 + b^2 = c^2$, which proves the Pythagorean Theorem. ■

IWBAT understand the Pythagorean Theorem more deeply.

The Pythagorean Theorem

How can we prove that the Pythagorean Theorem doesn't apply to all triangles?

The Converse of the Pythagorean Theorem 9/26/16

IWBAT discover the converse of the Pythagorean Theorem

The Converse of the Pythagorean Theorem 9/26/16

Three positive integers that work in the Pythagorean equation are called Pythagorean triples. For example, 8-15-17 is a Pythagorean triple because $8^2 + 15^2 = 17^2$.

Here are nine sets of Pythagorean triples.

3-4-5	5-12-13	7-24-25	8-15-17
6-8-10	10-24-26		16-30-34
9-12-15			
12-16-20			

- Choose any of the black triples to measure out in centimeters on your paper as line segments. Construct a triangle from this set of segments. What is the largest angle?
- Repeat with another triple.
- State your results as a conjecture.

Converse of the Pythagorean Theorem

If the lengths of the three sides of a triangle satisfy the Pythagorean equation, then the triangle is a right triangle

The Converse of the Pythagorean Theorem

Proof: Converse of the Pythagorean Theorem

Conjecture: If the lengths of the three sides of a triangle work in the Pythagorean equation, then the triangle is a right triangle.

Given: a, b, c are the lengths of the sides of ΔABC and $a^2 + b^2 = c^2$

Show: ΔABC is a right triangle

Plan: Begin by constructing a second triangle, right triangle DEF (with $\angle F$ a right angle), with legs of lengths a and b and hypotenuse of length x. The plan is to show that $x = c$, so that the triangles are congruent. Then show that $\angle C$ and $\angle F$ are congruent. Once you show that $\angle C$ is a right angle, then ΔABC is a right triangle and the proof is complete.

Critique this plan.

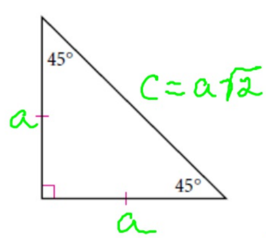
- practice simplifying square roots.



What kind of triangle is this? isosceles right Δ

What is the relationship between the legs and the hypotenuse?

$a^2 + a^2 = c^2$

$\sqrt{2a^2} = \sqrt{c^2}$

$a\sqrt{2} = c$

if $a = 38$, $c = 38\sqrt{2}$

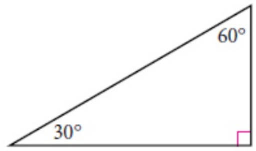
if $c = 12$, $a = \frac{12}{\sqrt{2}}\left(\frac{\sqrt{2}}{\sqrt{2}}\right) = \frac{12\sqrt{2}}{2} = 6\sqrt{2}$

Isosceles Right Triangle Conjecture

In an isosceles right triangle, if the legs have length l, then the hypotenuse has length l√2 .

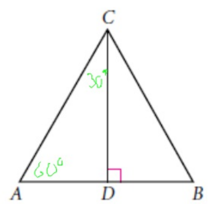
IWBAT discover the relationships among the lengths of the sides of a 45-45-90 triangle and a 30-60-90 triangle, and practice simplifying square roots.

Two Special Right Triangles



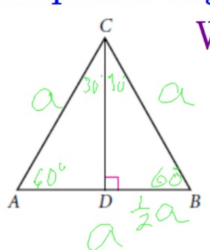
A 30°-60°-90° triangle

If you fold an equilateral triangle along one of its altitudes, the triangles you get are 30°-60°-90° triangles. A 30°-60°-90° triangle is half an equilateral triangle, so it also shows up often in mathematics and engineering.

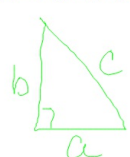


IWBAT discover the relationships among the lengths of the sides of a 45-45-90 triangle and a 30-60-90 triangle, and practice simplifying square roots.

Two Special Right Triangles



What do we know about this triangle?



$a^2+b^2=c^2$

$a^2+b^2=(2a)^2 = (2a)(2a)$

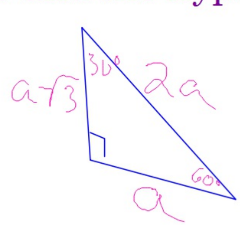
$a^2+b^2=4a^2$

$-a^2 \qquad -a^2$

$\sqrt{b^2}=\sqrt{3a^2}$

$b=a\sqrt{3}$

What is the relationship between the legs and the hypotenuse?



IWBAT discover the relationships among the lengths of the sides of a 45-45-90 triangle and a 30-60-90 triangle, and practice simplifying square roots.

Two Special Right Triangles

30°-60°-90° Triangle Conjecture

In a 30°-60°-90° triangle, if the shorter leg has length a, then the longer leg has length $a\sqrt{3}$ and the hypotenuse has length $2a$.

Use the Pythagorean Theorem to prove that this relationship is true for any 30°-60°-90° triangle.

$$a^2 + (a\sqrt{3})^2 = (2a)^2$$

$$a^2 + 3a^2 = 4a^2$$

$$4a^2 = 4a^2$$

IWBAT discover the relationships among the lengths of the sides of a 45-45-90 triangle and a 30-60-90 triangle, and practice simplifying square roots.

Two Special Right Triangles

Exercises DG p. 477-478 #1-11 all

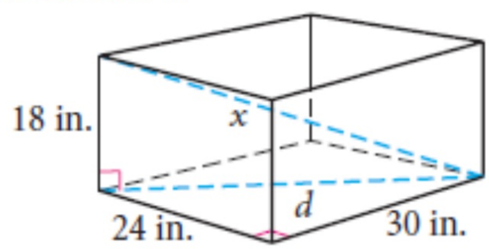
IWBAT discover the relationships among the lengths of the sides of a 45-45-90 triangle and a 30-60-90 triangle, and practice simplifying square roots.

Story Problems 9/29/16

IWBAT apply the Pythagorean Theorem and its converse to story problems.

Story Problems 9/28/16

What is the longest stick that will fit inside a 24-by-30-by-18-inch box?



$d^2 = 24^2 + 30^2$

$d^2 = 576 + 900$

$d^2 = 1476$

$x^2 = 1476 + 18^2$

$x^2 = 1476 + 324$

$x^2 = 1800$

$x = \sqrt{1800} = 10\sqrt{18} = 30\sqrt{2} \approx 42.4''$

IWBAT apply the Pythagorean Theorem and its converse to story problems.
